

The Platform, Explained Simply

Multi-tenancy = **one secure building, many private offices**. One website for everyone — but your badge only opens your own floor.

The big picture

You arrive

username + password

Security desk

Active Directory checks your ID

You get a badge

says your floor + what you can open

Rooftop — Building Manager all floors

Finance

their floor only

HR

their floor only

Sales

their floor only

Each company has a **private floor** (a “tenant”). Everyone uses the same front door, but **no one can walk onto another company’s floor**.

Three kinds of people

Building Manager

SUPER ADMIN

Runs the whole building. Leases floors to new companies, appoints their managers, can visit any floor.

Floor Manager

TENANT ADMIN

Runs **one** floor — adds or removes their own staff and arranges their rooms. Cannot touch other floors.

Employee

USER

Works on their floor and uses the rooms they're allowed into. Manages no one.

How logging in works

1

Sign in

username + password

2

ID checked

Active Directory confirms it's you

3

Get a badge

your floor + what you can open

4

Doors check it

you only see your own floor

How the building gets set up

1. Lease a floor

Manager onboards a new company (tenant)

2. Appoint manager

creates that floor's Floor Manager

3. Add staff

Floor Manager adds employees

4. Everyone logs in

gets a badge, works on their floor

The golden rule

Your badge decides your floor — and the building **never** lets you onto someone else's floor. This is checked at **every single door** (every action), not just at the entrance.
